

工程會|API問題

 □ Date	@Nov 4, 2020
Owner	FangKo Chen
Participant	
≔ Team	
∷ 開會類型	Meeting

Common

GET /common/get_recommend_lists/: (→) A1

GET /common/get_hot_tags/: → A1、A2

POST /common/get_list/: (\rightarrow) D1.1、D1.2

GET /common/search_tags/: X

Auth

POST /auth/register/: A0

POST /auth/login/: A0

POST /auth/logout/: A0

User

POST /user/get_user_places/: (→) C1、D1.2

POST /user/modify_place_tag/: C1

POST /user/get_user_lists/: (→) C2

POST /user/create_list/: c1

POST /user/add_list_places/: D1.2

POST /user/search_user_places/: D1.2

POST /user/remove_list_places/: D1.2

POST /user/get_list_info/: (C2、D1.2) → c2

POST /user/edit_list/: c2

POST /user/modify_list_photo/: C2

Мар

POST /map/get_marks/: (→) A2

POST /map/get_place_info/: A2

POST /map/search_tag/: (A2 \checkmark C1 \rightarrow) a2

POST /map/get_place_tag/: (A2、C1 \rightarrow) a2(A2、C1 \rightarrow) a2

POST /map/candidate_tag/: (A2 \checkmark C1 \rightarrow) a2

頁面備註: A0(登入)、A1(探索清單)、A2(探索地點)、C1(口袋地點)、C2(我的清單)、D1.1(清單條列)、D1.2(清單條列編輯)a1(地點info)、a2(為地點加tag)、c1(建立清單)、c2(編輯清單info)

	user_tag type:1(KingTag), 2(UserTag) 所有回傳的user_tag (filter、autocomplete) 都會扣除type:1的tags
	system_tag: 目前暫定是存在placeDb的type(從google map撈來的,一個地點只有一個)
	tagEvent type: 1(filter add), 2(filter remove), 3(modify add), 4(modify remove)
	list privacy: 1(公開), 2(私人)
П	左列的tag都需要給兩個tag陣列: user_tags, system_tags

Common

GET /common/get_recommend_lists/: (→) A1

□ 若使用者使用左邊標籤篩選探索頁的清單,也是用這支api?

/common/get_recommend_lists/→ 若是:改為POST、新增request body(filter 為tag_id陣列)、response只需清單名稱及照片、response需增加: user_tags 物件陣列, system_tags物件陣列

```
body
{
    "filter": [
          1,
          2
     ]
}
```

```
{
  "status": 1,
  "msg": "string",
  "data": {
```

```
"lists": [
      {
       "id": 0,
       "user_id": 0,
       "privacy": 0,
       "name": "string",
       "description": "string",
       "coverImageURL": "string",
       "createdTime": 0,
       "updatedTime": 0
    ],
      "user_tags": [
         "id": 0,
         "name": "string"
    ],
    "system_tags": [
        "name": "string"
   ],
 },
}
```

GET /common/get_hot_tags/: → A1、A2

□ 左邊所有的tags的「使用者標籤」跟「系統標籤」傳成兩個陣列較容易處理

POST /common/get_list/: (→) D1.1、D1.2

□ 地點目前只需以下□ gmap_id應該要是字串(混了字母與數字)□ 日期用處理好的字串格式給前端可能較好□ 「使用者標籤」跟「系統標籤」傳成兩個陣列 同上

```
"info": {
      "id": 0,
      "user_id": 0,
      "privacy": 0,
      "name": "string",
      "description": "string",
      "coverImageURL": "string",
"createdTime": 0; "string",
      "updatedTime": 9 "string"
"places": [
        "id": 0,
        "gmap_id": 0, "string",
        "name": "string",
        "phone": "string",
       "type": "string", ?
        "location": f
         "lon": 0,
         "lat": 0
        "photo": "urlstring",
      }
    ],
"user_tags": [
        "id": 0,
       <u>"type": 0,</u>
        "name": "string"
    ],
"system_tags": [
     {
        "name": "string"
      }
    ]
```

GET /common/search_tags/: X

□ 資策會目前暫定只在為地點加標籤的dialog使用呼叫後端的autocomplete,左側標籤篩選欄的autocomplete目前會先用前端做(資策會不會用到這支)

Auth

POST /auth/register/: A0

POST /auth/login/: A0

□ "api_key"是用token嗎?

POST /auth/logout/: A0

User

POST /user/get_user_places/: (→) C1、D1.2

- □ 缺此支api? (取得user所有曾經給過標籤的地點們)
- ☐ request body給tag_id陣列作為篩選條件、response data給地點、兩個tags陣列

```
{
   "filter": [
        1,
        2
    ]
}
```

```
{
  "status": 1,
  "msg": "string",
  "data": {
    "places": [
        "id": 0,
        "gmap_id": "string"
        "name": "string",
        "phone": "string",
     }
    ],
    "user_tags": [
       "id": 0,
       "name": "string"
    ],
    "system_tags": [
```

```
"name": "string"
],
}
```

POST /user/modify_place_tag/: C1

POST /user/get_user_lists/: (→) C2

□ 只需清單id、照片、名稱; tags兩個陣列同上

與/common/get_recommend_lists/回傳內容相同(只差後端篩選會取得檔頭中的 api_key判斷出user_id作為第二層篩選)

```
"status": 1,
  "msg": "string",
  "data": {
    "lists": [
      {
        "id": 0,
        "user_id": 0,
        "privacy": 0,
        "name": "string",
        "description": "string",
        "coverImageURL": "string",
        "createdTime": 0,
        "updatedTime": 0
    ],
      "user_tags": [
          "id": 0,
          "name": "string"
    ],
    "system_tags": [
          "name": "string"
    ],
  },
}
```

POST /user/create_list/: c1

□ 目前會傾向直接將整個照片以byte[]存進資料庫(一期暫定),但若存整張照片,後端無法將照片與其他資訊同時傳入。目前介面設計成分開的地方傳。

□ 有需要回傳 "data": {"id": 1} 嗎?

```
{
  "name": "string",
  "description": "string",
  "coverImageURL": "string",
  "privacy": 0, 1,
  "places": [
    1,
    2
  ]
}
```

POST /user/add_list_places/: D1.2

POST /user/search_user_places/: D1.2

□ 缺此支api? (使用者要幫清單加地點時,搜尋地點的autocomplete)

```
{
   "list_id": 0,
   "text": "string"
}
```

POST /user/remove_list_places/: D1.2

POST /user/get_list_info/: (C2, D1.2) \rightarrow c2

□ 缺此api? 從清單們的頁面,點選某清單的編輯,會跳出編輯該清單的dialog,後端回傳清單內容顯示在dialog內(目前後端回傳name, description, privacy)

```
{
    "list_id": 0,
```

```
}
  "status": 1,
  "msg": "string",
  "data": {
    "info": {
     "id": 0,
     "name": "string",
     "privacy": 0,
     "description": "string"
   },
 }
POST /user/edit_list/: c2
☐ request body沒有list_id(目前直接把id放在url)
□ 照片與清單資訊目前設計成分開處理
   "name": "string",
  "description": "string",
  "coverImageURL": "string",
  "privacy": 0
 }
POST /user/modify_list_photo/: C2
□ 缺此api,需確認要傳url還是byte陣列? (目前暫定一個清單只綁定一張照片)
Map
POST /map/get_marks/: (→) A2
□ 目前地圖上只插資料庫內有的地點
☐ request body是否還需給訂範圍?
□ 使用者篩選後,應該依據tag filter 回傳mark, tags
   "from": {
    "lon": 0,
    "at": 0
```

```
},
"to": {
    "lon": 0,
    "lat": 0
},
"filter": [
    1,
    2
]
}
```

```
{
  "status": 1,
  "msg": "string",
  "data": {
    "marks": [
        "gmap_id": 0, "string",
       "location": {
         "lon": 0, (decimal?)
         "lat": 0
      }
    ],
      "user_tags": [
         "id": 0,
         "name": "string"
    ],
    "system_tags": [
          "name": "string"
   ],
 }
}
```

POST /map/get_place_info/: A2

```
□ request body的 "gmap_id": "string"□ response的type是做什麼用的?□ response需加照片
```

```
{
    "status": 1,
    "msg": "string",
```

```
"data": {
    "name": "string",
    "phone": "string",
    "address": "string",
    "type": "string",
    "photo": "urlstring"
}
```

POST /map/search_tag/: $(A2, C1 \rightarrow)$ a2

- □ 在口袋地點頁會使用同個dialog,以下三支api需要改到/user/嗎?
- □ 應該只會回傳user_tags?
- → 若只回傳user_tags: 不需傳type、且後端已先判斷並剔除type=1的KingTags
- → 若也會回傳system_tags: 目前system_tags在place type裡,沒有id也沒有 type,如何解決?
- □ user_tags需扣除KingTag
- □ 資策會目前type都先拿掉

```
{
    "gmap_id": 0,
    <del>_"type": "string",</del>
    "text": "string"
}
```

POST /map/get_place_tag/: (A2, C1 \rightarrow) a2(A2, C1 \rightarrow) a2

```
{
    "status": 1,
```

POST /map/candidate_tag/: (A2、C1 →) a2

□ 目前只能看到/選擇使用者tag(不能切換user_tags跟system_tags)

```
{
    "gmap_id": 0,
    <del>"type": "string",</del>
    "limit": 0
}
```

☐ common/set_tag_event:
request body: { typeld: int, tagld: int}
不需response data
